Histological examination of a transparent corneal graft after keratoplasty OPTHALMOLOGICA (Basel) 1955, 130/5 (344-353) Illus. 16

An absolutely transparent corneal graft and the receiving cornea could be examined after the patient's death, which occurred 9.5 months after a partial perforating keratoplasty 4 mm. in diameter, which had not given rise to any complication. Histological examination of the graft revealed that it presented all the characteristics of a normal transparent cornea. Sourdille - Nantes

**AUTHORS:** Bieber, Boleslav, Engineer Doctor, Vejmlík, Bohuš,  
Engineer and Večeřa, Zdeněk, Doctor of Natural Sciences

**TITLE:** Determination of Carbon and Sulphur in Steel and Cast Iron  
by Means of High-frequency Combustion

**PERIODICAL:** Hutnické listy, 1959, Nr 8, pp 700 - 706

**ABSTRACT:** Experiments are described for determining the carbon and sulphur contents by means of a high-frequency generator designed for ascertaining the carbon content by burning in an oxygen stream, built by Siemens of Austria. Figure 2 shows the schematic diagram of the electrical circuit of the used HF generator. Figures 3 and 4 show photographs of the equipment and of the combustion tube. It was found that determination of carbon and sulphur contents in specimens of commercially pure iron by high-frequency burning in an oxygen stream has two considerable advantages compared with using a Mars silite furnace, namely, the equipment is instantaneously ready for carrying out experiments and a very considerable saving of electricity is achieved. The specimen, in the form of fine chips, is charged into a combustion "boat" which is

Card1/4

Determination of Carbon and Sulphur in Steel and Cast Iron by Means  
of High-frequency Combustion

CZECH/34-59-8-10/16

placed into a protective tube inside a horizontal quartz tube in the heating coil of the instrument. The specimen is heated as a result of the hysteresis and eddy-current losses produced by the high-frequency field and then ignites and burns off in the oxygen stream. It is assumed that during combustion the temperature reaches about 1 000 °C. Tin or rose metal proved suitable as slag-forming additions. During the process of combustion, the combustion boat and the protective tube have to withstand a considerable heat shock and of the tested materials, fireclay proved suitable. For determining the carbon content in the combustion products after high-frequency heating in an oxygen stream, the gas-metering method according to ČSN (Czech Standard Specification) 42 0510A and the weight method, according to ČSN 42 0510B proved suitable; the obtained results are in good agreement with those obtained by the current method based on using a Mars furnace. For determining the sulphur content, the iodometric method, according to ČSN 42 0514 A, was tried out;

Card2/4

CZECH/34-59-8-10/16

Determination of Carbon and Sulphur in Steel and Cast Iron by Means of High-frequency Combustion

the results were somewhat higher than those obtained under ordinary conditions of combustion in a Mars furnace at 1 350 °C and this is attributed to the higher combustion temperature at high frequency which does not leave behind sulphur residues in the molten<sup>and</sup> burnt substance. The advantages of the high-frequency combustion will manifest themselves particularly in cases in which the carbon and sulphur contents have to be determined only at irregular intervals. The cost of the high-frequency equipment is considerably higher than that of a Mars furnace. Furthermore, it necessitates using fireclay combustion "boats" and protective tubes. There are 7 figures, 5 tables and 18 references, of which 9 are Czech, 8 English, and 1 Swedish.

TITLE: Contribution to the discussion on the analysis of nonlinear circuits

PERIODICAL: Slaboproudý obzor, v. 24, no. 4, 1963, 204 - 208

TEXT: The authors discuss in general terms the origin of nonlinearities in the mathematical analysis of physical (technical) systems, and the reasons for taking them into account. They distinguish between the "analysis" and the "method of analysis". Analysis has three stages - construction of the mathematical model, solution of the model and discussion of the solution. The "method of analysis" seems to be related to the procedures for the first two stages since the authors refer to the "methods" of Van der Pol, Rausch, Poincaré, etc.

"Hyperventilatory Changes of the Endexpiratory Level in Asthmatic  
Children."

Prague, Casopis Lekaru Ceskych, Vol 105, No 49-50, 9 Dec 66, pp  
1377 - 1381

Abstract [Authors' English summary modified]: Voluntary hyper-  
ventilation with active expiration was studied using 6 various  
frequencies in 2 groups of children: 53 healthy ones, and 53  
symptom-free asthmatic children. The hyperventilatory response  
depends on the frequency and was different in the two groups.  
The most characteristic differences between the two groups were  
found in a frequency of breathing of 37.5 cycles per minute.  
At this frequency the pathological functional changes in asth-  
matic children are most obvious. 2 Figures, 2 Western, 3 Czech  
references.

Title : Possibility of Replacing Gravel by Crushed Stone

Orig Pub: Stavivo, 1955, 33, No 12, 407-408

Abstract: A comparative characteristic is given of the  
properties of gravel and crushed stone. The  
possibility and expedience of substituting crushed  
stone for gravel, in concrete, are noted.

MO Detoxicating properties of 2,3-dimercaptopropanol in the treatment of acute and chronic poisoning with arsenic and mercury. Zd. Votava and L. Vojvodová (Výzkumný a kontrolní ústav Spofa, Prague). *Časopis lékařů českých* 89, 514-17(1950).—No detoxicating properties of 2,3-dimercaptopropanol (I) in acute neosphenamine and mapharsen poisoning could be demonstrated in rabbits and mice. Acute and chronic HgCl<sub>2</sub> poisoning responded favorably to I. The L.D.<sub>50</sub> for intramuscularly applied I is for mice 114 mg./kg., for rats 128 mg./kg. Anthony Zenisek
